AB A method for detecting base mismatches between a pair of nucleic acid strands is described. One of the pair, a capture sequence, is immobilized on a magnetic particle through a ligand receptor mechanism, e.g. by binding a biotinylated nucleic acid to an avidin- or streptavidin-coated

particle. The other strand, or test sample, is labeled with a reporter group such as fluorescein. The sample is captured by the beads using std. hybridization methods under conditions that are tolerant of mismatches. The sample is then incubated with a resolvase to nick the DNA at any base mismatches. The digestion products are then analyzed **electrophoretically**.
